NOTE: This flow diagram represents an overview of population criteria requirements. **Refer to the eCQM specification for a complete list of data elements included in this measure and required for submission.**

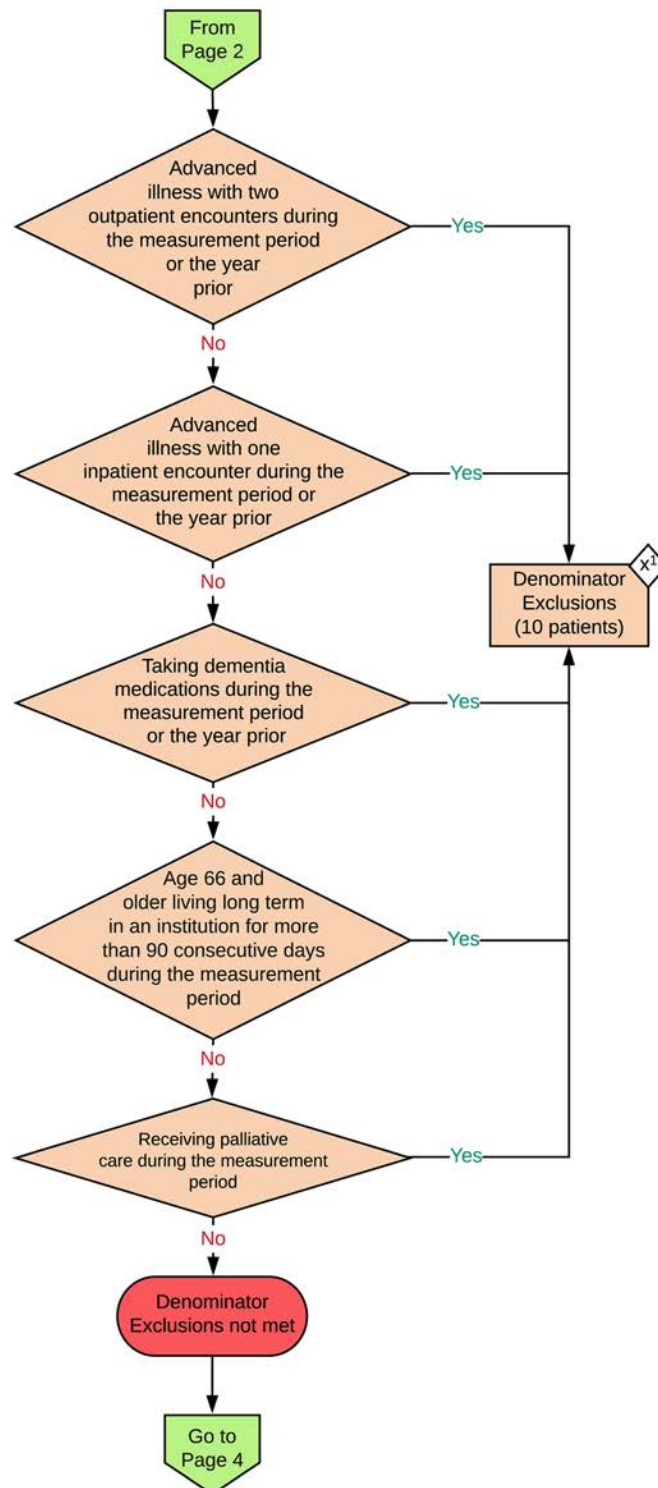

Breast Cancer Screening

Percentage of women 50-74 years of age who had a mammogram to screen for breast cancer in the 27 months prior to the end of the Measurement Period

This eCQM is a patient-based measure

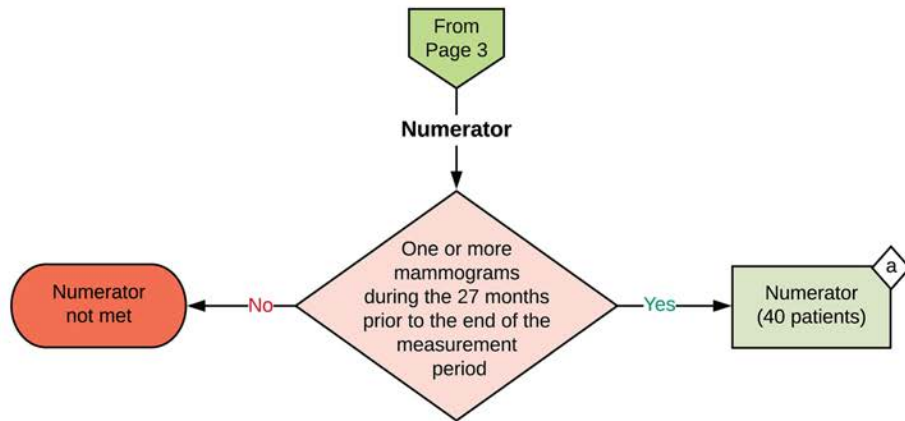

2022 eCQM Flow

Breast Cancer Screening

Sample Calculation

Performance Rate =

Numerator (a = 40 patients)

Denominator (b = 100 patients) - Denominator Exclusions ($x^1 + x^2 = 20$ patients)

$$= \frac{40}{80} = 50\%$$

eCQM Identifier: CMS125v10
eCQM Title: Breast Cancer Screening

NOTE: This flow diagram represents an overview of population criteria requirements. Refer to the eCQM specification for a complete list of data elements included in this measure and required for submission.

Description: Percentage of women 50 to 74 years of age who had a mammogram to screen for breast cancer in the 27 months prior to the end of the Measurement Period.

This eCQM is a patient-based measure.

eCQM Flow Narrative

Initial Population

Start by identifying the Initial Population, which includes women 51 to 74 years of age with an eligible encounter during the measurement period.

Denominator

The Denominator equals the Initial Population. In the sample calculation provided at the end of the eCQM flow, the Denominator is equal to 100 patients.

Denominator Exclusions

The Denominator Exclusions criteria identify a subset of the Denominator population by excluding women whose hospice care overlaps the measurement period, women for whom there is evidence of a right and a left unilateral mastectomy, women who have a history of a bilateral mastectomy, women who had a bilateral mastectomy during the measurement period, women age 66 and older who are living long term in an institution for more than 90 consecutive days during the measurement period, women age 66 and older with frailty and advanced illness with two outpatient encounters during the measurement period or the year prior, women age 66 and older with frailty and advanced illness with one inpatient encounter during the measurement period or the year prior, women age 66 with frailty and taking dementia medications during the measurement period or the year prior, and women whose palliative care overlaps the measurement period. In the sample calculation provided at the end of the eCQM flow, the Denominator Exclusions are equal to 20 patients.

Numerator

The Numerator criteria identify a subset of the Denominator population (that did not meet the Denominator Exclusions criteria) by including women who had one or more mammograms during the 27 months prior to the end of the measurement period. In the sample calculation provided at the end of the eCQM flow, the Numerator is equal to 40 patients.

Sample Calculation

A sample calculation is provided to help determine how the measure performance rate is derived. The measure performance rate is calculated by dividing the Numerator (total equals 40 patients) by the difference between the Denominator (total equals 100 patients) and the Denominator Exclusions (total equals 20 patients), which is equal to a score of 50 percent.
